

1. What is the router's hostname? Router
2. How many Fast Ethernet interfaces does the Router have? 4
3. How many Gigabit Ethernet interfaces does the Router have? 2
4. How many Serial interfaces does the router have? 2
5. What is the range of values shown for the vty lines? 0-4
6. Why does the router respond with the startup-config is not present message?
The configuration file is not saved to NVRAM which is why the router responds with that message.
7. What command do you use? Show running-config
8. Why should every router have a message-of-the-day (MOTD) banner?
MOTD banners are very important as it reminds users that access is permissible for authorized users only.
9. If you are not prompted for a password before reaching the user EXEC prompt, what console line command did you forget to configure? R1(config-line)#login
10. Why would the enable secret password allow access to the privileged EXEC mode and the enable password no longer be valid?
Since the enable secret password cancels out the enable password and when both are configured then the enable secret password is compulsory in order to access privileged EXEC mode.
11. If you configure any more passwords on the router, are they displayed in the configuration file as plain text or in encrypted form? Explain.
All configured passwords are displayed in encrypted form.
12. What command did you enter to save the configuration to NVRAM?
Copy running-config startup-config
13. What is the shortest, unambiguous version of this command? Cop r st?
14. How many files are currently stored in flash? There are 3 files in flash

15. Which of these files would you guess is the IOS image?

c1900-universalk9-mz.SPA.151-4.M4.bin

16. Why do you think this file is the IOS image? Due to the length of the file.
